Changing the subject to suit the context

1 You can divide both sides of the formula $s \times t = d$ by t to make s the ___________. Tick **1** correct answer

- [ ] divisor
- [ ] equation
- [x] subject
- [ ] substitution

2 $s = \frac{d}{t}$ can be rearranged as $s \times t = d$ and $t = \frac{d}{s}$. Which arrangement is the most useful if you know time and speed and wish to calculate distance? Tick **1** correct answer

- [ ] $s = \frac{d}{t}$
- [x] $s \times t = d$
- [ ] $t = \frac{d}{s}$

3 Which of these arrangements of the formula for area of a circle is most useful if you know the area and wish to find the radius? Tick **1** correct answer

- [ ] $A = \pi r^2$
- [ ] $\frac{A}{\pi} = r^2$
- [x] $\sqrt{\frac{A}{\pi}} = r$
- [ ] $\frac{A}{r^2} = \pi$
