

Constructing rhombi

- Isosceles triangles have two equal-sized angles. Two of the three edges are equal in length. Fill in the blank
- As this triangle is isosceles, the angle marked a is 32°. Fill in the blank

- Which of these could be a sketch of an equilateral triangle? Tick **1** correct answer

☐

☐

☒

☐

- Which of the following sets of lengths could be the edges of a triangle? Tick **3** correct answers

- ☒ 6 cm, 8 cm and 10 cm
- ☐ 30 mm, 42 mm and 95 mm
- ☐ 2.6 cm, 63 mm and 10.6 cm
- ☒ 12 mm, 4.7 cm and 5.2 cm
- ☒ 10 m, 12 m and 18 m

5 Select all the statements which are true of all quadrilaterals. Tick **2** correct answers

- ☒ All quadrilaterals have four edges.
- ☐ Interior angles of all quadrilaterals sum to 180° .
- ☐ All quadrilaterals have at least one set of parallel sides.
- ☒ All quadrilaterals can be split into two triangles.
- ☐ All quadrilaterals have a right angle.

6 Put the steps of constructing an equilateral triangle in order. Use numbers to show the correct order

1	Use your pencil and ruler to draw one edge to the required length.
4	Put the needle point on the other end of the line segment.
2	Set the width of the pair of compasses to the length of the drawn edge.
5	Check the width of the pair of compasses is still the length of the edge.
7	Connect the point of intersection to the ends of the line segment.
6	Draw an arc, which intersects with the first arc.
3	With the needle point on one end of the line segment, draw an arc.
