

Bisecting an angle

Task A: Constructing a rhombus from an angle

1) Complete each construction to draw a rhombus.

rhombus A

rhombus B

rhombus C

2) Complete each construction to draw a rhombus.

rhombus B

rhombus A

rhombus C

Using a protractor, measure the opposite angles of each rhombus. If each pair of opposite angles are the same size, then your construction is accurate!

Task B: Efficient construction of a rhombus

1) By only drawing arcs and straight lines, complete the construction of each rhombus.

Task C: Bisecting an angle using rhombi constructions

- 1) These constructions show partially drawn angle bisectors.
 - a) Using a protractor, measure the acute or obtuse angle.
 - b) Complete each construction.
 - c) Using a protractor, measure the bisected angle and check it is half the original angle.

2) Bisect each of the given angles, and measure the size of the bisected angle.
