

Name: _____

Additive relationships

Task A: Rearranging additive relationships

1) Write the family of rearrangements for the below equations. Draw a bar model to support if needed.

a)

$$58 + 76 = 134$$

b)

$$19 - h = 11$$

c)

$$y - x = 3$$

d)

$$100 - 2x = 5y^2$$

2) Lucas is rearranging equations.

I see a lot of it as 'swapping positions' in the equation.

In each case decide if Lucas is correct and write a sentence to justify your decision.

a)

If $3v + 5w = 52$ then
 $5w + 3v = 52$ is also true.

b)

If $73 - 8x = 49$ then
 $73 - 49 = 8x$ is also true.

c)

If $3x - 2 = 8y$ then
 $8y - 2 = 3x$ is also true.

Task B: The sum of multiple terms as a term

1) Fill in the blanks in these rearrangements:

a) $j + k + 8 = 13$

$$j = 13 - (\quad)$$

b) $j + k + 8 = 13$

$$k = 13 - (\quad)$$

c) $7x + 8y + 9z = 10$

$$7x = 10 - (\quad)$$

d) $7x + 8y + 9z = 10$

$$9z = 10 - (\quad)$$

e) $3x^2 + 7y^3 - 4 = 10$

$$3x^2 = 10 - (\quad)$$

f) $3x^2 - 7y^3 + 4 = 10$

$$3x^2 = 10 - (\quad)$$

2) Alex has done really well in this lesson but has made a few errors. Mark his work on rearranging and write a sentence to explain any errors you spot.

a) $x + 3y + z = 7$

$$x = 7 - (3y + z)$$

b) $9x^3 - y^2 + 1 = 8$

$$9x^3 = 8 - (y^2 + 1)$$

c) $x + 3y + 5 = 7$

$$x = 7 - (3y + 5)$$

$$x = 7 - 3y + 5$$

$$x = 12 - 3y$$

d) $5d + 2e^3 - 4 = 10$

$$5d = 10 - (2e^3 - 4)$$

$$5d = 10 - 2e^3 + 4$$

$$5d = 14 - 2e^3$$
