

Congruent triangles (RHS)

- The hypotenuse is the side of a right-angle triangle which is opposite the right angle. Fill in the blank
- Which side in this triangle is the hypotenuse? Tick **1** correct answer

- ☐ f
- ☒ g
- ☐ h

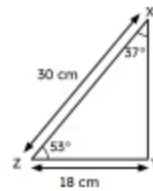

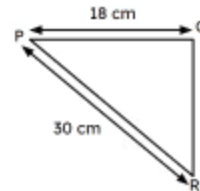

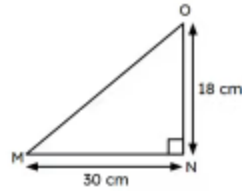

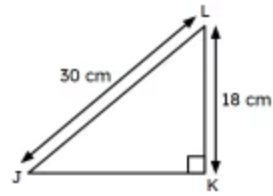

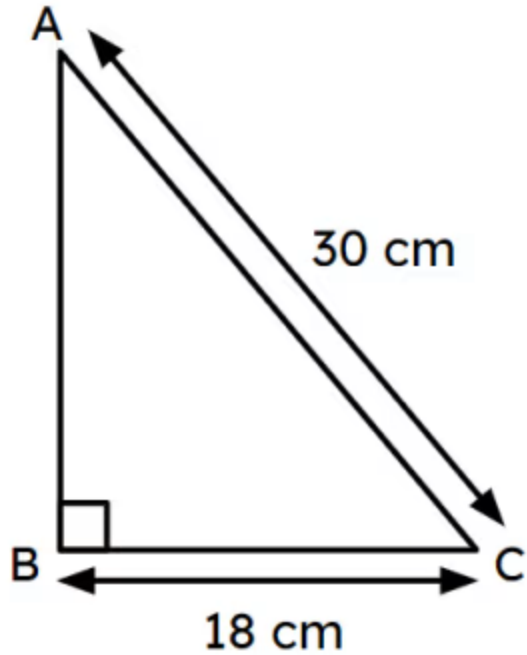

- Triangle ABC and JKL are congruent by _____. Tick **1** correct answer

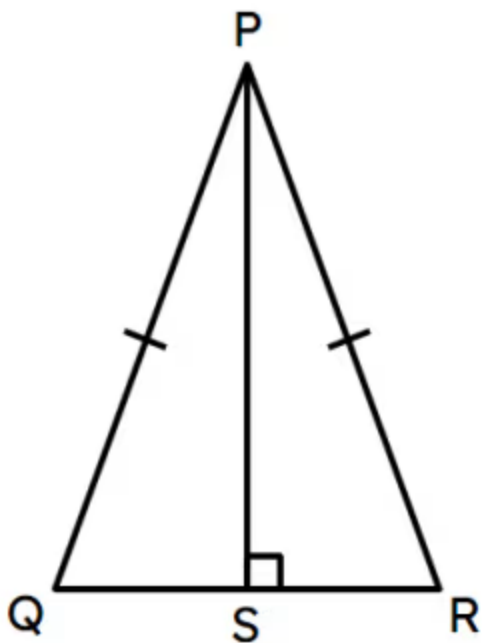

- ☐ ASA
- ☒ RHS
- ☐ SAS
- ☐ SSS

4 Which of these triangles are congruent to triangle ABC? Tick 2 correct answers

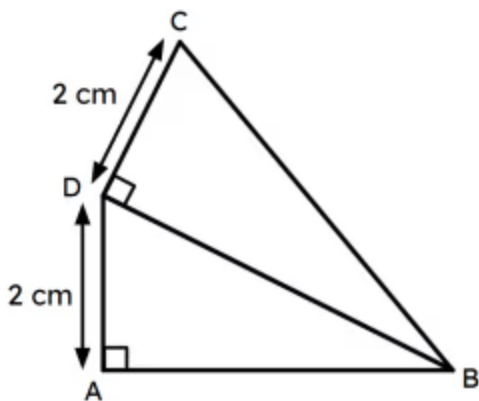

- 5 Match each statement to a correct justification to prove that triangle PQS is congruent to triangle PRS by RHS. Write the correct letter in each box

a	$PQ = PR$
b	$\angle PSQ = \angle PSR = 90^\circ$
c	PS

c	is a common edge to both triangles PQS and PRS
a	given on the diagram. PQR is an isosceles triangle.
b	given on the diagram. PS is the altitude of the triangle.

- 6 Can triangles ABD and BCD ever be congruent? Tick 1 correct answer

- ☐ Yes - they both share a side, they both have a right angle and one side is 2 cm
- ☒ No - the hypotenuse of one is a short side of another
- ☐ Not enough information - you do not know the other angles in the triangle
