

Equations and their graphs

Task A: Reviewing features of linear graphs

1) Gradient of 6 and a y -intercept of $(0, -2)$ is a description unique to graph (a). Write descriptions for b) and c)

2) Match the linear equations to their respective lines.

a) $y = 2x + 3$

b) $y = 3 - 2x$

c) $y = -3 - 2x$

d) $y = 2x - 3$

3) Laura is writing the equation of this linear graph.

I see a change of 3 in y and a change of 2 in x and an intercept of 4 so this is the line

$$y = \frac{3}{2}x + 4$$

Write at least two sentences to explain Laura's errors to her. You may choose to annotate the graph in your explanation.

Task B: Sketching linear graphs

1) Sketch the lines $y = 2x + 10$, $y = 5 - 4x$, and $y = 2x - 5$ on the below axes.

2) Match the linear equations to their respective lines.

a) $y = 2x - \frac{1}{4}$

b) $y = 18 - 2x$

c) $y = -5x + 18$

d) $y = \frac{1}{4}x - 2$
