

Constructing bar charts by utilising technology

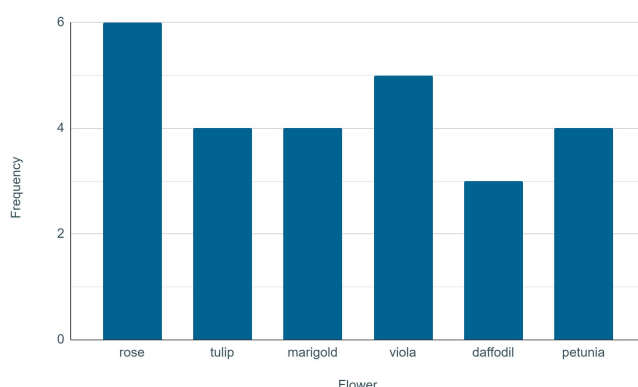

Task A: Creating bar charts on spreadsheet software

1) The flower sales at a garden centre are recorded.

a) Create a bar chart for this list of data:

rose, tulip, marigold, viola, rose, rose, marigold, viola, daffodil, tulip, daffodil, petunia, marigold, daffodil, rose, tulip, petunia, petunia, tulip, marigold, rose, viola, rose, petunia, viola, viola

Ensure it has a title on both axes.

It doesn't matter if you have changed the colours or scales.

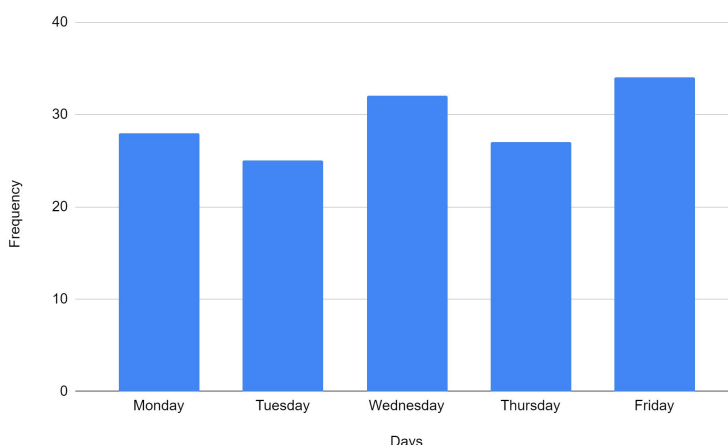

b) Would you advise the garden centre to order an equal amount of each flower next time or different amounts? Explain your answer.

Your response may have included:

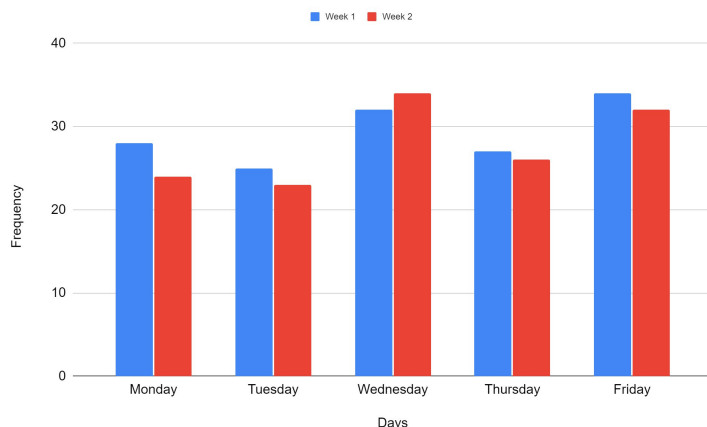

The total amount of sales is not very high, so although daffodil sales were the lowest on this particular day, it may not be the case on another day. The garden centre should collect further data to get a better understanding of the sales.

2) Create a bar chart for this table of data about visitors to a museum.

Day of the week	Frequency
Monday	28
Tuesday	25
Wednesday	32
Thursday	27
Friday	34

- 3) Create a bar chart for this table of data about visitors to a museum.

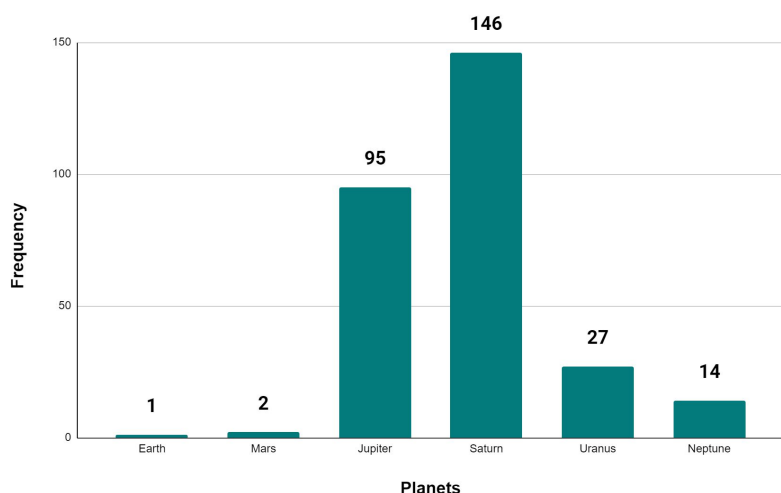

What is different about this bar chart?

It is a comparison bar chart, as there were two sets of data for the same thing.

Task B: Creating bar charts using a template file

- 1) Using the [Template file](#) recreate this bar chart.

The data should have been added like this.

	A	B	
1	Planet	Frequency	
2	Earth	1	
3	Mars	2	
4	Jupiter	95	
5	Saturn	146	
6	Uranus	27	
7	Neptune	14	
8			

- 2) [Task B Question 2](#) recreate this bar chart showing the number of time zones per country (including overseas territories).
