

Constructing scatter graphs by utilising technology

Task A: Constructing a scatter graph using a spreadsheet

1) Access the data for this task by clicking here: [Bradford weather data](#) 

Construct a scatter graph with the horizontal axis showing total rainfall and the vertical axis showing mean daily minimum temperature.

2) The scatter graphs below were plotted using the weather dataset.

Access the data for this task by clicking here: [Bradford weather data](#) 

Plot different scatter graphs to work out which variables go on the horizontal axis in each of the graphs below.

Task B: Constructing a scatter graph using Desmos

- 1) Access the data for this task by clicking here: [UK weather data](#)

Construct a scatter graph for Bradford's data, with the horizontal axis showing total rainfall and the vertical axis showing total sunshine duration.

- 2) Access the data for this task by clicking here: [UK weather data](#)

- a) Construct a scatter graph for Armagh's data, with the horizontal axis showing total sunshine duration and the vertical axis showing the mean of the daily maximum temperature.

- b) On the same graph plot the same data for Lerwick and make sure the points are a different colour to Armagh's data.

- c) Which town tends to get the warmest? *Amargh*
