

Problem solving with graphing linear relationships

Task A: Problems involving linear relationships

1) Andeep and Jun fill a bucket each from two different taps. This is graphed here.

- a) Who started with some water in their bucket already?
- b) Who had the smaller bucket?
- c) Whose tap has the faster rate of flow?
- d) When was Andeep's bucket half full?

2) In your town there are three taxi companies.

a) Fill in three tables of values and plot three lines.

Company A charge a flat rate of £4 then £2 for every mile travelled.

Company B charge a flat rate of £8 then £1 for every mile travelled.

Company C charge no flat rate and £4 for every mile travelled.

miles (m)	0	1	2	3	4	5
cost in £ (s)						

miles (m)	0	1	2	3	4	5
cost in £ (s)						

miles (m)	0	1	2	3	4	5
cost in £ (s)						

2) b) Write a paragraph explaining the conditions in which each firm is best.

Task B: Interpreting more complex linear graphs

1) Write a commentary to describe this race.

The distance units are metres. The time is in seconds.

Keep your commentary in chronological (time) order.
