

Considering a route

Task A: Planning a direct journey

- 1) Jacob (aged 14) and his mother are planning to travel to a theatre in a city centre. They want to arrive at the theatre by 2:45pm. They consider travelling by bus.

The nearest bus stop is on Oak Road, which is a 5-minute walk from their home. The bus stops directly outside the theatre.

A journey planner app says that a bus will depart from Oak Road at 1:48pm and arrive at the theatre at 2:36pm.

A single-way ticket on the bus costs £2 per adult and £1.20 per child (under 19).

- a) What is the latest time they can leave their home if they travel by bus?
b) What is the total cost of the journey to travel there and back by bus?

- 2) Jacob and his mother are planning to travel to a theatre in a city centre. They want to arrive at the theatre by 2:45pm. They consider travelling by car.

The nearest car park to the theatre is a 15-minute walk away.

A journey planner app says that the car park is 9 miles from their home and will take 35 minutes to drive to.

- a) What is the latest time they can leave their home if they travel by car?
b) What is the total cost of the journey to travel there and back by car?

- 3) Use a journey planning website to plan a journey.

The journey should be from your home to a destination that you could travel to directly by public transport (e.g. bus, train, underground).

Plan how you could make the journey by car and by public transport. Compare the time and cost implications of each.

You may wish to consider the following points:

- the distance between your home and where you would board the transport;
- the distance between where you would exit the transport and your destination;
- the time you would spend travelling in the transport;
- cost of a ticket on public transport;
- the cost of parking the car (if unsure, you could use £5.50 as an estimate);
- the cost of petrol by the car (if unsure, you could use the same as in Q2).

Task B: Planning a journey that includes changeovers

- 1) Sofia has a university interview in an office in London.
She needs to arrive at the office before 11am.

The office is a 15-minute walk from London Kings Cross Station.
Her nearest train station, Oakington, is a 10-minute walk from her home.
The train is not direct. She would need to change trains at Elmsville.
Some possible train times are below.

- a) What is the latest possible time that Sofia can leave her home to arrive for her interview?

departs Oakington	07:03	07:33	08:03
arrives at Elmsville	07:27	07:57	08:27

departs Elmsville	07:40	08:00	08:40
arrives at London	09:44	10:20	10:44

- b) What could go wrong if she leaves at the time in part (a)?
- c) Suggest a more cautious time that Sofia could leave her home.

- 2) Use a journey planning website to plan a journey.

The journey should be from your home to a destination that you could travel to by public transport. However, the journey should include at least 1 changeover when using public transport (e.g. a bus and then a train).

Plan how you could make the journey by public transport.
You may wish to consider the following points:

- the distance between your home and where you would first board transport;
- the distance between where you would exit the transport and your destination;
- the time you would spend travelling during each stage of the journey;
- the amount of time during your changeover;
- the total amount of time for the entire journey;
- cost of a ticket on the public transport for each stage of the journey.
