

Calculating the median

Task A: Median from a line graph

- 1) Work out the median minimum temperature for both Aberporth and Lowestoft.

Aberporth 9°C

Lowestoft 8°C

Task B: Median from an ungrouped frequency table

- 1) Complete the missing frequencies.

star rating	frequency
1	16
2	25
3	34
4	54
5	31

star rating	frequency
1	16
2 or less	41
3 or less	75
4 or less	129
5 or less	160

- 2) Work out the median for these data sets

a)

goals scored	frequency
0	12
1	27
2	43
3	37
4	10

Median goals scored is 2

b)

tube lines	frequency
1	204
2	53
3	19
4	5
5	3
6	1

Median number of tube lines is 1

- c) For each of your answers to parts a and b, justify why your answers are sensible

Part a, the data are fairly symmetrical

Part b, over 50% of the data are 1

Task C: Median from a bar chart

- 1) Here is a bar chart showing the food hygiene ratings for a group of local restaurants.

- a) How many restaurants is this data about?

85 restaurants

- b) What is the position of the median?

43rd data point

- c) What is the median food hygiene rating?

Food hygiene rating of 3

- 2) Here is a bar chart showing the food hygiene ratings for restaurants in two towns. Calculate the median food hygiene rating for each town.

Town A:

101 ratings

Median is the 51st value

45 restaurants are 2 or less

64 restaurants are 3 or less

So the median is a rating of 3.

Town B:

113 ratings

Median is the 57th value

41 restaurants are 2 or less

65 restaurants are 3 or less

So the median is a rating of 3.
