

Understanding the mode

Task A: Finding a mode

1) What is the **modal** animal?

The spider as it appeared 4 times compared to 3 beetles, 3 cats and 2 dogs.

2) In this set of data, what is the **mode**?

0, 0, 0, 0, 0, 1, 1, 1, 1, 1, 1, 2, 2, 2, 3, 3, 3, 3, 3, 4, 4, 5, 5, 5, 5

*1 is the **mode**, it appears 6 times which is the most occurrence compared to the other data*

3) In this set of data, what is the **mode**?

12, 16, 18, 12, 19, 18, 15, 16, 18, 19, 12, 12, 18, 15, 18

*Ordering the data, shows the repeats more clearly:
12, 12, 12, 12, 15, 15, 16, 16, 18, 18, 18, 18, 19, 19
The **mode** is 18.*

4) Sofia was rolling an eight-sided dice.

What was the **mode** roll on the dice?

I rolled a 6 ten times;
I rolled a 7 twelve times;
I rolled an 8 ten times.

*7 is the **mode** roll. It occurred 12 times compared to 10 times of each 6 and 8.*

Task B: It is not always one mode

1) Write a data set of 20, that is **bimodal**.

There are multiple correct answers for this. Two values should be repeated the same number of times as each other.

For example: 0, 0, 0, 1, 1, 2, 2, 3, 3, 3, 4, 4, 4, 4, 5, 5, 5, 5, 6, 6

2) Write a data set of 10, that has no **mode**.

There are multiple correct answers for this. Nothing should occur more than anything else.

For example: pink, white, red, blue, green, orange, brown, yellow, purple, teal

3) Write a data set of 20, that is **trimodal**.

There are multiple correct answers for this. Three values should be repeated the same amount as each other.

For example: 0, 0, 1, 1, 2, 2, 3, 3, 3, 3, 4, 4, 4, 4, 5, 5, 5, 5, 6, 6

4) For each data set, write how many **modes** the data has, if any.

*bimodal - 2
modes*

*trimodal - 3
modes*

*trimodal - 3
modes*

1 mode

5) What is the **mode** of the data shown on this dot plot?

*The data is **bimodal**.
The **modes** are 74.5 and 80.*
