

Using the formula for the area of a circle

Task A: Finding areas of circles by using the formula

1) Find the area of each circle, giving your answers as decimals rounded to 3 significant figures. Diagrams are not drawn to scale.

a) circle with radius 6 m

b) circle with diameter 6 m

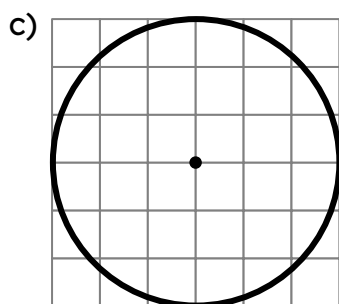

2) Find the area of each circle, giving your answers in terms of π .

a) The distance from the centre of the circle to the circumference is 12 cm.

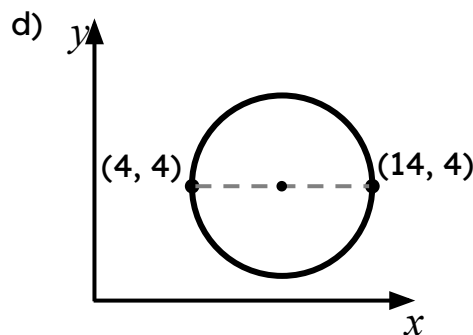

area = _____ cm^2

b) The furthest distance from one side of the circle to the other is 12 cm.

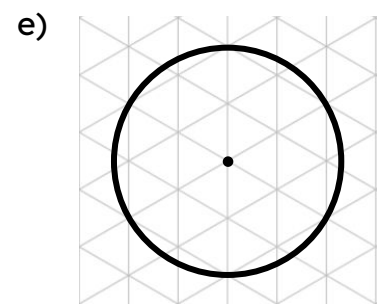

area = _____ cm^2

area = _____ units^2

area = _____ units^2

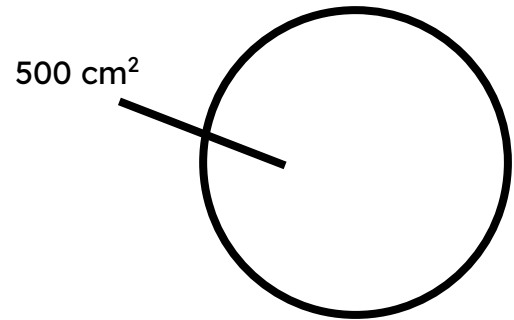

area = _____ units^2

Task B: Finding the radius or diameter when the area is known

1) The area of the circle is 500 cm^2 .

For each question, give your answer to 1 decimal place.

a) Calculate the radius.

b) Calculate the diameter.

c) Calculate circumference.
