

Checking understanding of place value in integers

Task A: Reviewing integer place value

1) Write down the value of the **digit** 8 in each **integer**:

- a) 285 80
- b) 2805 800
- c) 20 805 205 800 000
- d) 5 000 308 8
- e) 58 353 8000

2) Write the **integer** 20 805 205 in words.

Twenty million, eight hundred and five thousand, two hundred and five

3) Write these using **digits**.

You could use a place value chart to help.

- a) Five hundred and sixteen thousand, two hundred and twelve.
516 212
- b) Forty-two million, ninety-three thousand, seven hundred and one.
42 093 701

4) Give an example of an **integer** which:

a) is greater than 1000

e.g. 35 678

b) and is less than 2000

e.g. 1678

c) and has a 5 in the tens place

e.g. 1658

d) and contains the **digits** 3 and 9

1359 or 1953

Task B: Using place value

Here are some **digit** cards:

1) Use the digit cards to create:

a) the largest possible 5-**digit integer**

98 760

b) the smallest possible 5-**digit integer**

60 789

c) the 5-**digit integer** that is closest to 90 000

89 760

d) the smallest possible 5-**digit even integer**

60 798

2) Using these cards, how many different 5-**digit integers** can you create between 50 000 and 70 000?

How do you know?

60 789, 60 798, 60 879, 60 897, 60 978, 60 987
67 089, 67 098, 67 809, 67 890, 67 908, 67 980
68 079, 68 097, 68 709, 68 790, 68 907, 68 970
69 078, 69 087, 69 708, 69 780, 69 807, 69 870

I know the only digit I can start with is the 6. I then used the other digits, writing the integers in ascending order.
