

Name: _____

Problem solving with place value

Task A: Same measure, different units

Here is an important reminder about two types of triangles.

An isosceles triangle has two sides which are the same length.

A scalene triangle has no sides with the same length.

For each set of measurements, deduce if they are the lengths of a scalene or an isosceles triangle.

1) 1.739 m, 173.9 cm, 1793 mm

2) 0.032 km, 3020 cm, 32 000 mm

3) 5.1 cm, 0.000053 km, 50.3 mm

4) Izzy has measured the sides of a triangle.

Why might you think that Izzy has made an error?

I measured
lengths of 31.2 cm,
24.9 cm and 9.3
mm

How could you check?

Task B: Determining useful units of measure

1) Fill in the gaps using an appropriate unit of measure from the box.

I recently visited Paris. It took 2 _____ and 37 _____ to get there by train. I visited the Eiffel Tower, which is 330 _____ tall. Whilst at the Eiffel Tower, I visited a souvenir shop and bought 0.5 _____ of sweets to share with my friends.

grams	kilograms	millimeters	centimeters	metres	kilometers
seconds	minutes	hours	millilitres		

2) Which metric measures might be used to measure the following?

- a) Length of an ant
- b) Mass of a person
- c) Capacity of a bucket
- d) Height of a house

3) Which imperial measures might be used to measure the following?

- a) Length of an ant
- b) Mass of a person
- c) Capacity of a bucket
- d) Height of a house
