

## Deepening understanding of place value in integers

---

### Task A: Read integers aloud and consider the context

1) Fill in the missing integers or words.

a)  $300\ 000 = 300 \text{ thousands} = 3000 \text{ hundreds} = 30\ 000 \text{ tens}$

b)  $45\ 000 = 45 \text{ thousands} = 450 \text{ hundreds} = 4500 \text{ tens}$

c)  $5\ 600\ 000 = 56\ 100 \text{ thousands} = 560 \text{ } 10 \text{ thousands} = 56\ 000 \text{ hundreds}$

d)  $84\ 500\ 000 = 8450 \text{ } 10 \text{ thousands} = 8\ 450\ 000 \text{ tens} = 84.5 \text{ millions}$

---

## Task B: Write an integer described in different ways

1) Find the odd one out in each set.

|    |                    |                   |                  |                      |
|----|--------------------|-------------------|------------------|----------------------|
| a) | 40 thousands       | 40 ten thousands  | 4000 tens        | 400 hundreds         |
| b) | 6 million          | 600 000 tens      | 60 000 thousands | 60 hundred thousands |
| c) | 1200 tens          | 120 thousands     | 12 ten thousands | 1200 hundreds        |
| d) | 5780 ten thousands | 5 780 000 tens    | 578 000 hundreds | 578 million          |
| e) | 8.4 million        | 840 ten thousands | 8400 hundreds    | 84 hundred thousands |

2) Use all the digit cards to create:

|   |   |   |   |   |
|---|---|---|---|---|
| 9 | 7 | 0 | 6 | 8 |
|---|---|---|---|---|

a) an integer with 76 hundreds *e.g. 87 609*

b) an integer with 976 hundreds *e.g. 97 680*

c) an integer with 76 tens *e.g. 90 768*

d) an integer with 90 hundreds *e.g. 79 068*
