

Plotting non-integer coordinates

Task A: Coordinates with non-integer values

1) Plot the following coordinates:

A (0.5, -2.5)

B (-0.5, 2.5)

C $(-2.25, \frac{1}{2})$

D $(\frac{-3}{2}, \frac{-7}{4})$

2) Match the coordinates to the points on the graph:

A (1.8, 2.2)

B (2.1, 1.7)

C (-2.1, 1.6)

D (-1.6, 1.6)

E (1.6, -1.6)

3) Jun says this.

The point is just past -3 so this is probably (-3.1, 4)

Write a sentence justifying why Jun is wrong.

Your sentence might have included:

From the direction of the origin the coordinate is still approaching -3 so it is more likely to approximate as (-2.9, 4).

Task B: Shapes with non-integer value coordinates

1) Find the missing coordinates of these rectangles.

2) Find the missing x coordinate values in these isosceles triangles.

$$\frac{3 + 8}{2} = \frac{11}{2} = 5.5$$

$$\frac{0.5 + 8}{2} = 4.25$$

3) These four equally sized squares sit between the origin and coordinate (1,1)

Find coordinates A and B.

$$1 \div 4 = 0.25$$

Coordinate A (0.25, 0.5)

Coordinate B (0.75, 0.75)
