

Equally likely outcomes

Task A: Listing possible outcomes

1) In each question a **trial** consists of a single spin of the spinner. Write down the **sample space** for each **trial**.

2) In each question a **trial** consists of a single spin of the spinner. Use the **sample spaces** to complete the spinner. There may be more than one possible answer.

Task B: Recognising when two outcomes are equally likely

1) Tick the spinners where the **outcomes** 'win' and 'lose' are equally likely.

Task C: Recognising more than two equally likely outcomes

1) Complete the spinners to make the outcomes equally likely to happen.

a) $\xi = \{A, B\}$

b) $\xi = \{\text{win, lose}\}$

c) $\xi = \{\text{even number, odd number}\}$

d) $\xi = \{\text{green, blue}\}$

e) $\xi = \{\text{vowel, consonant}\}$

f) $\xi = \{A, B, C\}$

2) Aisha, Jun and Izzy are playing a game that involves rolling a regular 6-sided dice.

Aisha's piece moves if the dice roll is 1 or 2.

Jun's piece moves if the dice roll is 3 or 4.

Izzy's piece moves if the dice roll is 5 or 6.

a) Izzy thinks that 6 is the most difficult number on the dice to roll.

Explain why this is incorrect.

b) The **sample space** to show the possible **outcomes** to each **trial**.

$\xi = \{\text{Aisha moves, Jun moves, Izzy moves}\}$

Explain why these outcomes are equally likely to happen.
