

Calculating theoretical probabilities from lists (one event)

- 1 The probability that an event will occur is the proportion of times the event is expected to happen in a suitably large experiment. Fill in the blank
- 2 Which letter on the probability scale represents a probability of 0.5? Tick **1** correct answer

- ☐ A
- ☐ B
- ☒ C
- ☐ D
- ☐ E

- 3 The spinner is divided into equal-sized sectors. What fraction of the spinner is labelled 'win'? Tick **1** correct answer

- ☐ $\frac{1}{2}$
- ☐ $\frac{1}{3}$
- ☐ $\frac{2}{3}$
- ☒ $\frac{2}{5}$

- 4 The spinner is divided into equal-sized sectors. 60 % of the spinner is labelled 'lose'. Fill in the blank

- 5 A trial has three possible outcomes: {A, B, C}. $P(A) = \frac{2}{7}$. $P(B) = \frac{1}{7}$. $P(C) = \frac{4}{7}$. Which outcome is most likely to happen? Tick **1** correct answer

☐ A

☐ B

☒ C

- 6 The probability on an outcome is 25%. Approximately how many times could you expect the outcome to occur in 500 trials? Tick **1** correct answer

☐ 25

☐ 50

☐ 100

☒ 125

☐ 250
