

Solving two step linear equations

Task A: Solving using an additive step first

1) Manipulate the balance scale to solve the equation:

$$3x - 10 = 2$$

2) Solve the following equations:

a) $9x + 7 = 25$

b) $9x - 7 = 25$

c) $4 = 5y + 19$

d) $\frac{1}{2}x + 7 = 25$

Task B: Multiple approaches to solving the same equation

1) Solve these equations two different ways.

a) $2x + 18 = 30$

b) $3d - 27 = 9$

c) $35 - 7x = 21$

$$2x + 18 = 30$$

$$3d - 27 = 9$$

$$35 - 7x = 21$$

2) Solve: $\frac{13}{4} - \frac{x}{8} = \frac{7}{2}$
