

Solving linear equations where brackets are used

- 1 $8(x + 5) = 5(2x - 4)$ is an example of _____. Tick **1** correct answer
- ☐ an expression
- ☐ an unknown
- ☒ an equation
- ☐ a substitution
- 2 Which of these show a correct method and solution for the equation $9(y - 3) = 45$? Tick **2** correct answers
- ☐ $y - 3 = 45$, therefore $y = 48$
- ☒ $y - 3 = 5$, therefore $y = 8$
- ☐ $9y - 3 = 45$, therefore $9y = 48$ and $y = \frac{48}{9}$
- ☒ $9y - 27 = 45$, therefore $9y = 72$ and $y = 8$
- ☐ $9y - 27 = 45$, therefore $9y = 18$ and $y = 2$
- 3 The solution to $8(x + 5) = 5(2x - 4)$ is $x = \underline{30}$. Fill in the blank
- 4 Solve $7(x + 5) = 5(2x - 4)$. Tick **1** correct answer
- ☐ $x = -\frac{55}{3}$
- ☐ $x = -5$
- ☐ $x = 5$
- ☒ $x = \frac{55}{3}$
