

Understanding advertising

Task A: Comparing promotions

1) Use two different methods to show that packs of 6 rolls are better value for money than packs of 4 rolls.

4 pack of soft rolls
90 p

6 pack of soft rolls
£1.20

E.g. Finding the price of 12

$$0.9 \times 3 = 2.7$$

$$1.2 \times 2 = 2.4$$

Packs of 6 are better value for money. 12 would cost £2.40 which is cheaper than buying in packs of 4 (£2.70)

Finding the unit price

$$0.9 \div 4 = 0.225 \quad (22.5 \text{ p per roll})$$

$$1.2 \div 6 = 0.2 \quad (20 \text{ p per roll})$$

The pack of 6 has a cheaper price per roll so is better value for money.

(There are other valid methods.)

2) Aisha needs 500 g of mushrooms for a recipe which feeds 2 people.

Mushrooms 150 g
80 p

Mushrooms 400 g
£1.10

Mushrooms 600 g
£1.80

a) For each pack, what is the price per 100 grams?

$$0.8 \div 1.5 = 0.533...$$

$$1.1 \div 4 = 0.275$$

$$1.8 \div 6 = 0.3$$

Approximately 53.3 p per 100 g

27.5 p per 100 g

30 p per 100 g

b) What would be the cheapest way to buy enough mushrooms to feed 2 people?

Even though the 400 g is better value for money, the cheapest way to get 500 g is buying one pack of 600 g at £1.80

c) What would be the cheapest way to buy enough mushrooms to feed 4 people?

Aisha would need 1000 grams.

$$1.1 \times 3 = 3.3$$

$$1.1 + 1.8 = 2.9$$

Buying one pack of 600 g and one pack of 400 g would be cheapest.

1200 g for £3.30

1000 g for £2.90

d) What would be the cheapest way to buy enough mushrooms to feed 8 people?

Aisha would need 2000 grams.

The 400 g pack is the best value for money and buying 5 would be exactly 2000 g so no wastage.

$$1.1 \times 5 = 5.5$$

5 packs of 400 g for £5.50

3) Which of these promotions are good value for money? Explain your answer.

Pears
39 p each

3 for £1

$$0.39 \times 3 = 1.17$$

Save 17 p when buying 3

This seems like a reasonable saving if you will eat 3 pears before they go off.

Ice cream tubs
£5.30 each

Any 4 for
£21

$$5.30 \times 4 = 21.2$$

Save 20 p when buying 4

Even though this is a higher saving than the pears it is on a much higher cost so as a percentage saving is less. You would also need to find space and a use for 4 tubs of ice cream.

This does offer slightly better value for money but not necessarily a good promotion.

Veggie
sausages
£2.30 each

Any 3
for £7

$$2.30 \times 3 = 6.90$$

The promotion is more expensive than the original price.

This is definitely not good value for money.

4) Lucas sees this promotion in a supermarket.

Fizzy orange
£1.80 each

Buy 1 get 1
half price

When I was in here last week they cost £1.30 each but there was no promotion.

Does this promotion offer a better deal than the price Lucas saw last week?

$$1.30 \times 2 = 2.6$$

At last week's price 2 bottles would cost £2.60

$$1.80 + 0.9 = 2.7$$

Buying one at full price and one at half price this week means 2 bottles cost £2.70

This promotion does not offer a saving compared to last week's prices.

Task B: Unit pricing

1) Which of these unit pricings are correct?

a)

Strawberries (400 g) £1.89 £4.73 per kg

$$1.89 \div 4 = 0.4725 \quad \text{Correct to 2 d.p.}$$

$$0.4725 \times 10 = 4.725$$

c)

Silverskin onions (440 g) 79 p 31 p per 100 g

$$79 \div 4.4 = 17.95 \quad \text{This is possibly a case where one is a mass when drained.}$$

Incorrect

b)

Twin pack Mango £1.79 89 p each

$$1.79 \div 2 = 0.895 \quad \text{Rounding conventions mean this should be 90 p}$$

$$89.5 \text{ p}$$

d)

Wrapping foil (20 m) 99 p 4 p per metre

$$99 \div 20 = 4.95 \quad \text{This is much closer to 5 p than 4 p so incorrect.}$$

2) Which of these is the best value for money?

Crisps 6 pk × 25 g
£1.25
0.83 p per gram

$$83.33... \text{ p per } 100 \text{ g}$$

Crisps 4 pk × 30 g
£1
25 p each

$$25 \text{ p for } 30 \text{ g}$$

$$8.333... \text{ p for } 10 \text{ g}$$

$$83.33... \text{ p for } 100 \text{ g}$$

Crisps 15 pk × 30 g
£3.80
£0.84 per 100 g

$$84.44... \text{ p for } 100 \text{ g}$$

Both the 6 pk of crisps and the 4 pk of crisps are the best value for money.

Task C: Analysing adverts

1) A 'low sugar' box of muesli advertises 20% less sugar.

a) How much sugar would be in 100 g of low sugar muesli?
16 grams

b) If a teaspoon is 4.2 grams how many teaspoons of sugar are in a 30 gram serving of low sugar muesli?

30 gram serving has 4.8 g of sugar

That is just over 1 teaspoon of sugar (1.14...)

$1 \frac{1}{7}$ of a teaspoon.

c) A different brand of muesli advertises 5.5 g of sugar per 40 gram serving. Which muesli has the least sugar?

5.5 g of sugar per 40 g is 13.75 g of sugar per 100 g.

This is a lower sugar content than the 'low sugar' version of the original muesli.

2) Roy's rides makes and sells motorbikes. Their advert claims:

Our motorbikes hold their value much better than our competitors.

a) The average depreciation of the value of a motorbike in its first year is 20%. What would a motorbike worth £2500 new be worth after one year?

$$2500 \times 0.8 = 2000$$

After 1 year the value would be £2000

Here are the figures for the value of a motorbike from Roy's rides and a motorbike from their nearest competitor.

	Roy's rides
New	£1800
1 yr old	£1350

	Competitor
New	£5200
1 yr old	£4420

b) Give a statistic to support the claim made by Roy's rides

$$1800 - 1350 = 450$$

$$5200 - 4420 = 780$$

There is a smaller decrease in value for the motorbike at Roy's rides than their competitor.

c) Give a statistic which does not support the claim.

$$1350 \div 1800 = 0.75 \text{ (25\% decrease)}$$

The motorbike at Roy's rides was cheaper initially. It depreciates by 25% whereas the competitor's depreciates by 15%.
