

Introduction to enlargements

Task A: Understanding enlargement

1) Write true or false for each statement.

a) **Enlargement** only refers to when a shape increases in size.

False

b) The image may have different lengths to the object after an **enlargement**.

True

c) The image may have different angles to the object after an **enlargement**.

False

d) The image can be smaller than object after an **enlargement**.

True

2) Alex is going to **enlarge** the parallelogram to double the size.

He thinks that the corresponding angle in the image will be 70° .

Do you think he is correct? Justify your answer.

No, Alex is not correct because...

- *enlarging a shape does not cause the angles to change size*
- *the corresponding angle will be 35°*

Task B: Understanding similarity

1) Match the rectangles which are **similar**.

2) Use square paper to accurately draw the right-angled triangle below.

a) Draw another right-angled triangle that is **similar** to this one.

The base and height should be pairs of numbers obtained by multiplying 4 and 3 by the same number. Examples: 8 and 6, 12 and 9, 16 and 12, 20 and 15, 2 and 1.5

b) Cut out each triangle. Place one triangle on top of the other and match up one of the vertices. What do you notice?

Corresponding angles are equal.
