

Deepening understanding with fractions of a given amount

Task A: Bar models to find the original amount

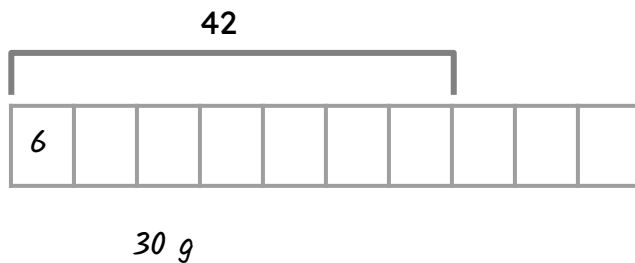

1) Match each problem to the correct bar model and solve.

a) Izzy is saving for a new camera. She has saved £42, which is two-fifths of the cost. How much does the camera cost?

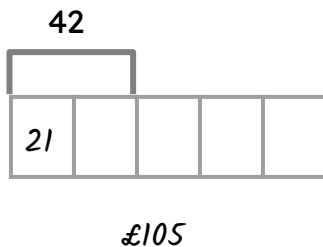

b) A packet of crisps contains two-fifths extra free; it weighs 42 grams. How heavy is the normal packet?

c) Alex buys a sweatshirt in a sale saving you two-fifths. It cost him £42. How much was it before the sale?

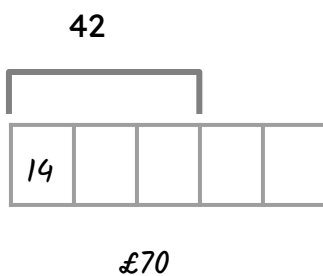

b)

a)

c)

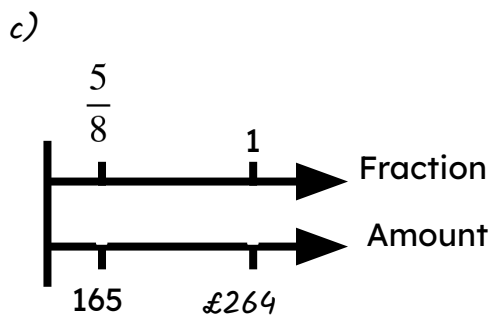

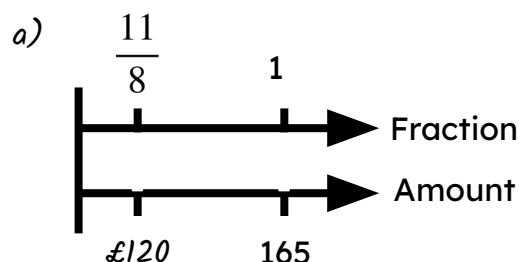

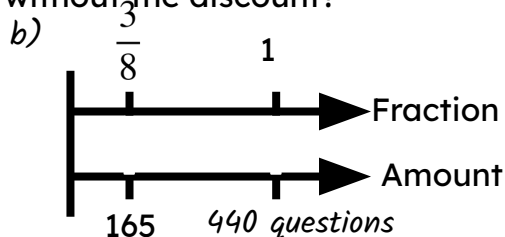

Task B: Using double number lines

1) Match each problem to its double number line and solve.

a) The price of a camera increases by three-eighths to £165. How much did it cost before the increase?

b) Alex takes part in a spelling competition. He gets 165 right. This is three-eighths of the questions. How many questions were in the competition?

c) A multi-buy offer gives a discount of three-eighths. If you pay £165, how much is it without the discount?

Task C: Finding the original amount using division

1) Jun gives £195 of his sponsorship money to his favourite charity; this is three-quarters of the total. How much money did Jun raise in total?

£260

2) A shop has a sale saving you one-third. Laura buys a t-shirt for £28. How much was it at full price?

£42

3) Alex improves his score on a computer game by two-sevenths. His improved score is 3204. What was his previous score?

2492

4) $1 \frac{3}{10}$ of 60 = $\frac{5}{9}$ of 140.4

What number is the square covering?

5) $\frac{2}{3}$ of $33x$ = $2 \frac{3}{4}$ of $8x$

What term is the square covering?
