

Securing understanding of percentages

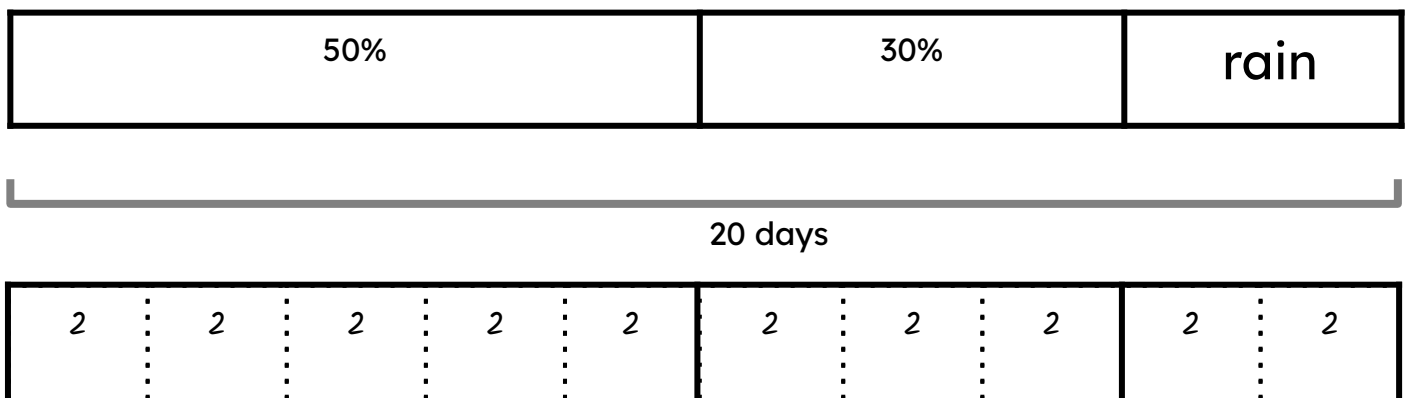

Task A: Finding percentages of amounts

1) Work out the percentage of the amount using bar models.

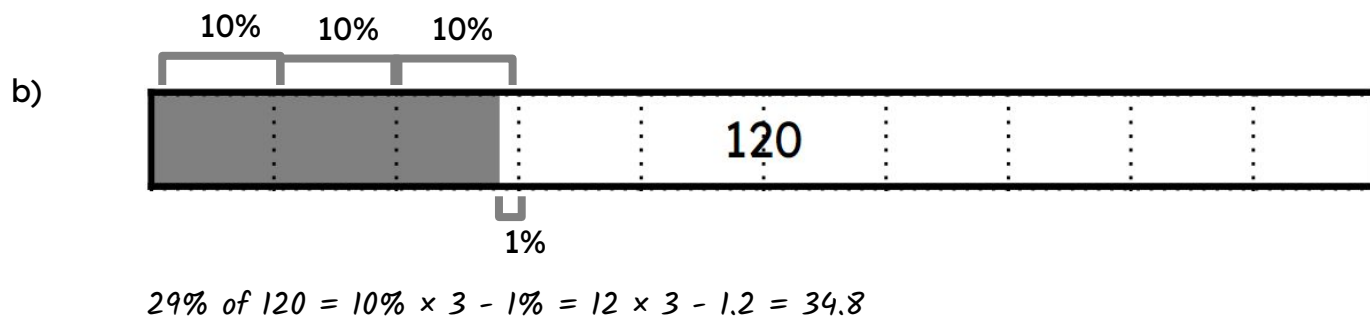

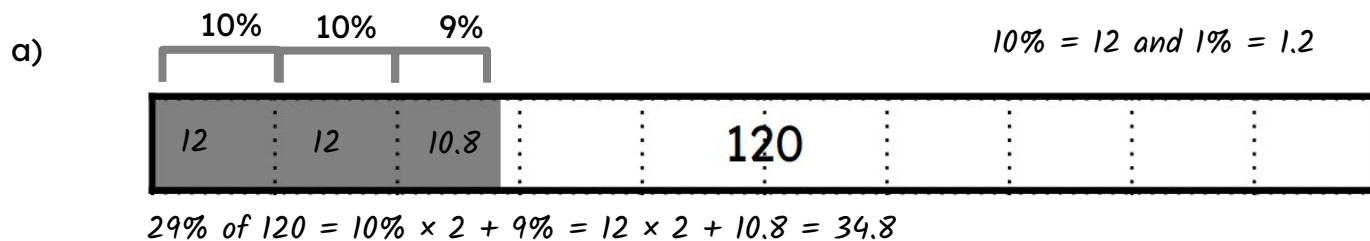

2) Here is a percentage bar to show the percentage of days that experienced different weather conditions.

Work out how many days were sunny, cloudy, or rainy.

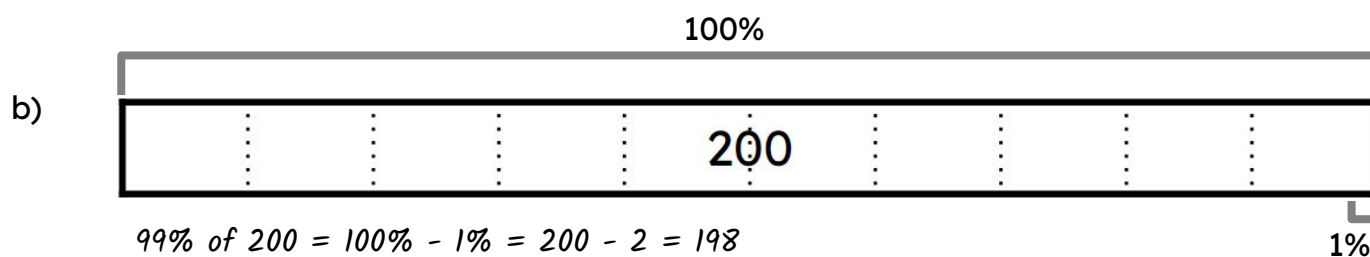

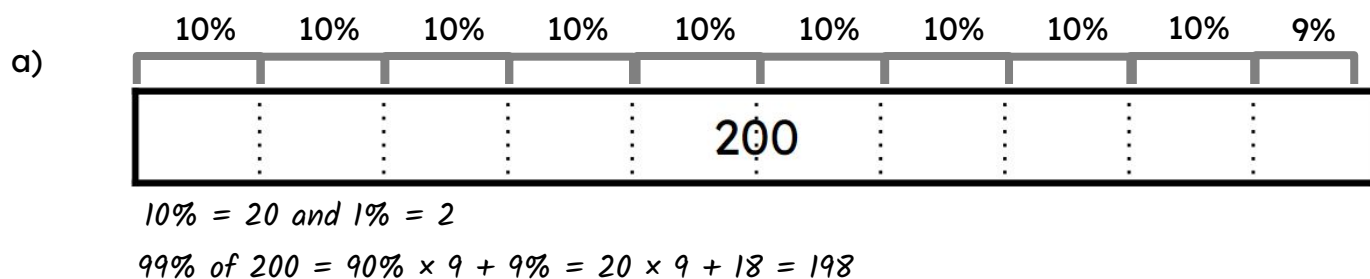

Sunny = 10 days, Cloudy = 6 days, Rainy = 4 days

3) Work out the 29% of 120 using the two different bar models

4) Show two different bar models to work out 99% of 200

Task B: Ratio tables

1) Using the ratio table, work out

a) 61% of $840 = 512.4$

b) 59% of $840 = 495.6$

c) 98% of $840 = 823.2$

Amount	%
840	100%
84	10%
8.4	1%
420	50%
16.8	2%
504	60%

2) Using any representation you prefer work out:

a) 23% of $720 = 165.6$

b) 11% of $940 = 103.4$

c) 49% of $56 = 27.44$

3) Write what you think are the advantages and disadvantages of using a bar model, double number line and ratio table when trying to find a percentage of an amount.

	Bar model	Double number line	Ratio table
Advantages	<i>Good visual representation</i>	<i>Good visual representation</i>	<i>Concise</i>
Disadvantages	<i>Takes time to draw</i>	<i>Takes time to draw as it is scaled</i>	<i>Doesn't show visual representation</i>
