

Finding the original amount after an increase

Task A: Finding the original value

- 1) Four friends live in different places. They draw bars to show the percentage of days that they experienced different weather.

Work out how many days were sunny, cloudy, rainy or stormy for each person.

£66

£36.80

£9360

- 2) Find the original cost for each of these items, given that:

- The price of the trainers has increased by 10%. £60
- The price of the sunglasses has increased by 15%. £32
- The price of the car has increased by 17%. £8000

Task B: Using a multiplier

- 1) Given the new amount and percentage increase find the original amount. All of the answers are in the grid except for one.

For i) Write a percentage question that gives this answer.

	Percentage Increase	New Amount
a	10%	357.5
b	15%	368
c	45%	493
d	12%	412.16
e	36%	522.24
f	80%	630
g	12.5%	391.5
h	3.6%	326.34
i	<i>E.g. 35%</i>	<i>445.5</i>

b 320	e 384	c 340
h 315	a 325	f 350
d 368	330	g 348

- 2) Complete this statement in several different ways.

a) Increase £_____ by _____% = £80

Eg. Increase £50 by 60% = £80; Increase £40 by 100% = £80; Increase £10 by 800% = £80

b) Increase £_____ by _____% = £250

Eg. Increase £200 by 25% = £250; Increase £160 by 56.25% = £250;

Increase £50 by 50% = £250

- 3) Try to use the multiplier method to answer the following:

a) A social media manager earns £34 980 a year. This includes a pay rise of 6%. What was their wage before the pay rise?

Their new wage includes the original wage (100%) and the pay rise (6%).
 $\text{original wage} = £34\,980 \div 1.06 = £33\,000$

b) The cost of a concert ticket is £89.60. This includes an increase of 28% on the previous year. What was the cost of the ticket last year?

Their new ticket includes the original cost (100%) and the increase (28%).

$\text{original cost} = £89.60 \div 1.28 = £70$
